# WEEK 5 PROGRESS REPORT

ROAD MAP

PROGRESS

Week 5

- Implemented the Paper: Personalizing Yelp Star Rating:
  - -----Add codeword after all the negative or positive words and manually label the topic with adjective (good or bad)

- Implemented the Paper: Hidden dimension of rating

Week 6

- Compared the results with traditional LDA

- Combine the results based on two papers above:
  - ----Use the topic and preference we get from LDA to initialize rating dimensions and minimize the loss function by gradient descent.
PAPER 1: PERSONALIZING YELP STAR RATING

- Motivation: Traditional topic modeling lacks methods of incorporating star ratings or semantic analysis in the generative process

- Method: Modified LDA – term distributions of topics are conditional on star ratings.

PAPER 1 METHOD

- Then a more appropriate LDA would model the conditional dependence between a rating *r* and *bk*.

- The way to implement the method: codeword

CODEWORD

- Find a dictionary of negative and positive stemmed words respectively

- Modify the corpus to include a *codeword*, "GOODREVIEW" or "BADREVIEW," after each positive or negative word, respectively

- *awesome car mainten famili servic honest fair priced*

- *GOODREVIEW car mainten famili servic honest GOODREVIEW fair GOODREVIEW priced*
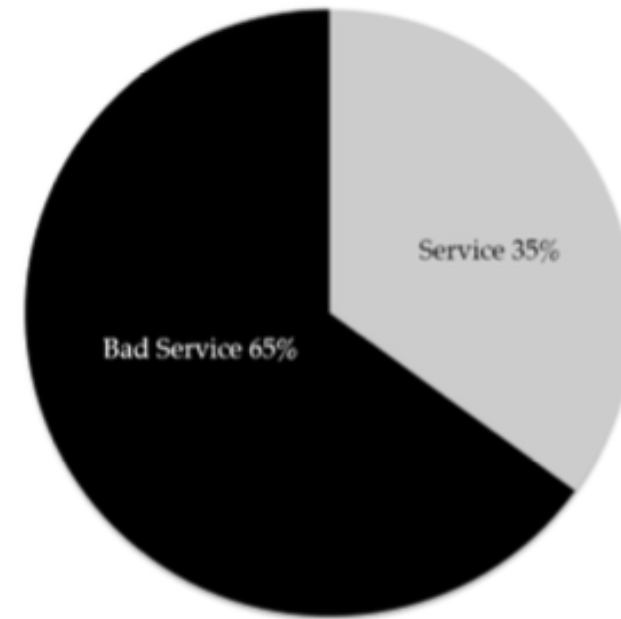

COMPARE

Traditional LDA

Asian Food 6%

Food 32%

Service 62%

Codeword LDA

Service 35%

Bad Service 65%
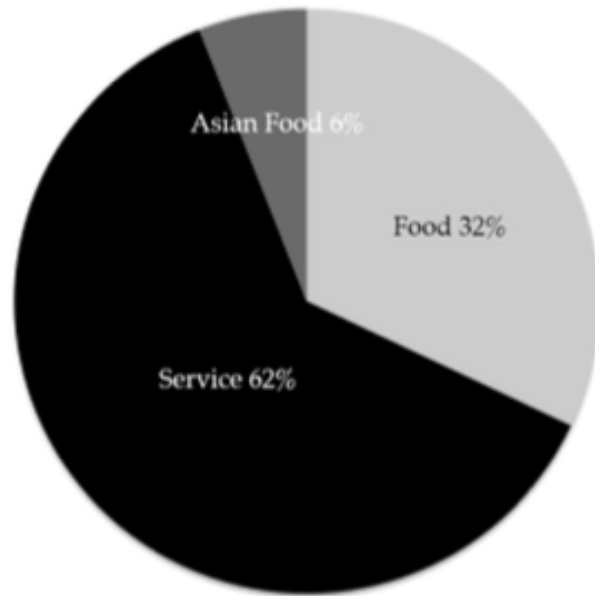

PAPER 2: HIDDEN DIMENSIONS

$$f(\mathcal{T}|\Theta, \Phi, \kappa, z) = \sum_{r_{u,i} \in \mathcal{T}} \underbrace{(rec(u,i) - r_{u,i})^2}_{\text{rating error}} - \mu \underbrace{l(\mathcal{T}|\theta, \phi, z)}_{\text{corpus likelihood}}.$$

SIMILARITY

- A model that links LDA with constraints derived from document relative similarities. Specifically, in our model, the constraints act as a regulorization term of the log likelihood of LDA.

$$\mathcal{L}(\boldsymbol{\lambda}) = \underbrace{\log p(\boldsymbol{w}|\boldsymbol{\lambda}, \boldsymbol{\beta})}_{\text{log likelihood}} + \underbrace{\log p(\boldsymbol{\lambda}|(\boldsymbol{0}, \sigma^2 \mathbf{I}))}_{\text{prior}} - \eta \underbrace{\sum_{i=1}^{T} \mathcal{L}_i(d_i, d_i^+, d_i^-)}_{\text{hinge loss}}$$
